

## Corkscrew Subdermal Needle Electrode

**Friendship Corkscrew Subdermal Needle Electrodes** are a special version of the normal Subdermal Needle Electrode used to collect bioelectric signals (EEG, ECG and EMG) from the body during clinical examinations, treatments and surgical operations

The corkscrew design is particularly useful during anesthesia as it attaches like a small screw needle to the top layer of the scalp so it stays securely in place. Two varieties of the corkscrew needle electrode are available.

## Corkscrew Subdermal Needle Electrode – Single

**Friendship Disposable Corkscrew Subdermal Needle Electrodes – Single** are a specially designed version of our Subdermal Needle Electrode intended for measuring EEG and EP signals, typically during interoperative monitoring. The corkscrew form is designed so it stays securely in place during surgery and examinations for clear and reliable results.
